Picture below is showing the hardware and casters already installed on base frame. Next, there are 3 side panels (2 are identical, and (1) will have threaded inserts, and that panel will be your center divider. When laying down the panels make sure all long wires are facing to the right side, and short wires are on the left (so if you're facing the unit the long wires will be to your right and the short wires will be to your left). Next, slide panels over base channels, then thread $3/8 \times 2''$ bolts and washers through base and into center divider threaded inserts, and then tighten all hardware. Next, top frame will have hardware already attach. Now just slide the top frame into side panels as you did the base, and thread the remaining $3/8 \times 2''$ bolts and washes into center divider, and then tighten hardware.

Next, attach all gusset plates, and then install hang-bar as pictured below. (You'll find two sets of brackets and hardware wrapped) Make sure hangers are on tube first then insert tube over one bracket end, then insert other bracket into other end of tube as pictured below and then attach bracket to grid, finally attach secure brackets and hardware as pictured below.

Finally install shelf as pictured below. (One end of shelf hooks must be to the right of long wires, and other end of shelf hooks are to the left of long wire.) See picture below.
